INTERNET OF THINGS

SECE3221

Unit-1

Introduction to Internet of Things

SYLLABUS

Course Content:

Section I

Module No.	Content	Hours	Weightage in %
1.	Introduction to IoT: Overview of IoT: Definition, scope, and applications, End-to-End IoT Architecture, Challenges and opportunities in IoT adoption. IoT Trends: Edge computing, AI integration, digital twins, fog computing, 5G for IoT, IoMT, IIoT, smart cities	03	10

Introduction to Internet of Things (IoT)

P P SAVANI
UNIVERSITY

- ? First of all we should discuss about the name “IoT – Internet of Things” in detail.

- ? So we have to discuss about the first word “Internet” and then everything about the “Things”.

Introduction to Internet of Things (IoT)

P P SAVANI
UNIVERSITY

? What is Internet?

? In simple word, it's a Network of Networks or Interconnected LANs.

? So here we have to discuss about the Network, and we already learned everything about network in the last semester, Right?

? What is Network?, Requirement for networking

Introduction to Internet of Things (IoT)

P P SAVANI
UNIVERSITY

- ❓ Nowadays The term Internet of Things (IoT) is an emerged the popular terms.
- ❑ There are multiple ways to define IoT, but the basic of all the definitions remains the same.
- ❓ IoT is network of interconnected computing devices which are embedded in everyday objects, enabling them to send and receive data.
- ❓ The IoT is not just limited to the connected or networked devices, but in a broad way IoT devices exchange meaningful information from one device to another to get desire result.

Introduction to Internet of Things (IoT)

P P SAVANI
UNIVERSITY

- IoT is not a single technology, it's a combination of technologies and domain knowledge.
- As a result, engineers from different domains have to work together for building a complete IoT product.

- Life would be governed entirely by Internet and IoT in the near future.

Application areas of IoT

P P SAVANI
UNIVERSITY

? The scope and application areas of IoT is very huge.

? IoT can be used to build applications for.

- Agriculture
- Assets Tracking
- Energy Sector
- Defense
- Embedded Applications
- Education
- Waste Management
- Healthcare Products
- Telemedicine
- Safety And Security Sector
- Smart City Applications etc.

Characteristics of IoT

P P SAVANI
UNIVERSITY

? Connectivity:

- ➔ Connectivity is an important and first requirement of IoT infrastructure.
- ➔ Every Things in IoT should be connected to the IoT infrastructure.
- ➔ Connectivity should be guaranteed at anywhere and anytime.

? Identity:

- ➔ Each IoT device has a unique identity (e.g., an IP address).
- ➔ This identity is helpful in communication, tracking and to know status of the things.

Characteristics of IoT

P P SAVANI
UNIVERSITY

? Intelligence:

- ➔ Just data collection is not enough in IoT, extraction of knowledge from the generated data is very important.
- ➔ For example, sensors generate data, but that data will only be useful if it is interpreted properly.
- ➔ So intelligence is one of the key characteristics in IoT.

Vertical Scaling

(Increase size of instance (RAM , CPU etc.))

Horizontal Scaling

(Add more instances)

? Scalability:

- ➔ The number of elements (devices) connected to IoT zone is increasing day by day.
- ➔ Therefore, an IoT setup should be capable of handling the expansion.
- ➔ It can be either expand capability in terms of processing power, Storage, etc as vertical scaling or horizontal scaling by multiplying with easy cloning

Characteristics of IoT

P P SAVANI
UNIVERSITY

? Dynamic and self-adapting (complexity):

- ➔ IoT devices should dynamically adapt themselves to the changing surroundings.
- ➔ For example surveillance camera. It should be flexible to work in different weather conditions and different light situations (morning, afternoon, or night).

? Architecture:

- ➔ IoT architecture is yet not uniformed and standardized.
- ➔ It should be hybrid, supporting different manufacturer's products to function in the IoT network.

Characteristics of IoT

P P SAVANI
UNIVERSITY

? Safety:

- Sensitive personal details of a user might be compromised when the devices are connected to the Internet.
- So data security is a major challenge.
- This could cause a loss to the user.
- Equipment in the huge IoT network may also be at risk.
- Therefore, equipment safety is also critical.

Things in IoT

- ? In the IoT, things refer to a variety of devices. It can be anything even humans in it become a thing.
- ? For something to qualify as a “thing”, it requires identity of its existence.
- ? The “thing” in a network can be monitored/measure. For example, a temperature sensor could be a thing.
- ? Things are capable of exchanging data with other connected devices in the system.
- ? The data could be stored in a centralized server (or cloud), processed there and a control action could be initiated.
- ? The devices having all the above characteristics are known as things.

Things in IoT

P P SAVANI
UNIVERSITY

- ? Some of the famous “things” are temperature sensors, pressure sensors, humidity sensors, etc.
- ? The data from these sensors are collected and sent it to the cloud or stored it in local server for data analysis.
- ? Based on the data analysis, the control action would be taken.
- ? For example, switching off the water heater remotely when the water is heated as per requirement.

Things in IoT

? Not just sensors, the following can also be called as things:

- Industrial motors
- Wearables(e.g., watch)
- Vehicles
- Shoes
- Heart monitoring implants(e.g., pacemaker, ECG real-time tracking)
- Biochip transponders (for animals in farms)
- Automobiles with built-in sensors (automobile feature real-time monitoring)
- Food/perishables quality measuring

Things in IoT

P P SAVANI
UNIVERSITY

❓ In IoT-based home automation, the “things” could be the following

- Lighting control and automation devices
- Ventilation devices
- Air conditioning [heating, ventilation and air conditioning (HVAC)] systems
- Appliances such as washer/dryer
- Air purifiers
- Ovens or refrigerators/freezers that use Wi-Fi for remote monitoring
- Security cameras
- Smart phones

IoT Stack

Following are the identified seven layers in IoT stack.

- Layer 1 (Physical or Sensor Layer)
- Layer 2 (Processing and Control Action layer)
- Layer 3 (Hardware Interface Layer)
- Layer 4 (RF Layer)
- Layer 5 (Session/Message Layer)
- Layer 6 (User Experience Layer)
- Layer 7 (Application Layer)

IoT Protocol Stack Layers

IoT Stack - Layer 1 (Physical or Sensor Layer)

P P SAVANI
UNIVERSITY

- ? This layer is concerned about the physical components, which mainly includes sensors.
- ? In this layer, the sensors are the core component.
- ? Temperature sensor, pressure sensor, humidity sensor, etc. can all be referred as physical layer components.
- ? In industrial automation, PLC, actuator, etc. are considered as physical layer components.
- ? This layer is responsible for data collection and action execution.
- ? Selection of sensors is important and choosing an appropriate sensor is the challenge in this layer.

IoT Stack - Layer 2

(Processing and Control Action Layer)

P P SAVANI
UNIVERSITY

- ? This important layer contains core components of IoT system.
- ? The microcontrollers or processors are found in this layer.
- ? The data is received by the microcontrollers from the sensors.
- ? A variety of development kits are available in the market; like Arduino, Raspberry Pi, Node MCU, PIC, ARM development boards, etc.
- ? Microcontroller/Processor and operating system play vital role at this layer
- ? Data collected from the sensors is processed in this layer.

IoT Stack - Layer 3

(Hardware Interface Layer)

P P SAVANI
UNIVERSITY

- ? The 3rd layer in the stack is the Hardware Interface Layer.
- ? Hardware components and communication standards such as RS232, CAN, SPI, SCI, I²C, etc. occupy this layer.
- ? All these components ensure flawless communication.
- ? Handshake happens here.

IoT Stack - Layer 4 (RF Layer)

P P SAVANI
UNIVERSITY

Classification:

Short Range (Low Bandwidth, High Bandwidth)

Long Range (Low Bandwidth, High Bandwidth)

Examples:

NFC, RFID, Wi-Fi, Bluetooth, BLE, Li-Fi, LTE

4

- ? Whenever one talks about IoT, RF is discussed and comes in picture.
- ? It plays a major role in the communication channel – whether it is short range or long range.
- ? Protocols used for communication and transport of data based on RF are listed in this layer.
- ? Some famous and common protocols are Wi-Fi, NFC, RFID, Bluetooth, Zigbee, etc.
- ? RF layer does communication of data using radio frequency based Electromagnetic (EM) waves
- ? This layer can also include Li-Fi; which are effective alternates for RF protocols.

IoT Stack - Layer 5

(Session/Message Layer)

P P SAVANI
UNIVERSITY

Session/Message layer
(Messaging is the content)

Some Protocols:
MQTT, CoAP, HTTP, FTP, SFTP, SSH

5

- ? Like computer network session management is also important in IoT.
- ? There are many protocols which manage how messages or data are broadcasted to the cloud.
- ? Layer 5 (session layer) deals with the various messaging protocols as MQTT, CoAP, etc. and also other protocols such as SSH and FTP.

IoT Stack - Layer 6

(User Experience Layer)

P P SAVANI
UNIVERSITY

- ? This layer deals with providing best experience to the end users of IoT products.
- ? The 6th layer takes care of rich UI designs with lots of features, which provide a pleasing experience while using the service/system or product.
- ? Object-oriented programming languages, scripting languages, analytics tools, etc. all should be included in this layer.
- ? This is also known as User Experience and Visualization Layer.

IoT Stack - Layer 7 (Application Layer)

P P SAVANI
UNIVERSITY

- ❓ Everything comes to perfection at this layer.
- ❓ This layer utilizes the rest six layers in order to develop desired application.
- ❓ It can range from a simple automation application to smart city application.
- ❓ After learning about the layers, it is now easier to relate them with an application, for example, vegetable quality monitoring during transport from source to the destination using IoT.

Enabling Technologies

- ? IoT is a collection of many technologies and devices.
- ? The simplest of sensors, embedded systems, data analytics, communication protocols, security aspects and cloud computing with storage have all become enabling technologies.
- ? Enabling technologies/devices fall under one of the following categories:
 - ↳ Technologies that help in acquiring/sensing data.
 - ↳ Technologies that help in analyzing/processing data.
 - ↳ Technologies that help in taking control action.
 - ↳ Technologies that help in enhancing security/privacy.

IoT Enabling Technologies

- Wireless Sensor Network

- Cloud Computing

- Big Data Analytics

- Communication Protocols

- Embedded Systems

Enabling Technologies - Sensors

Temperature Sensor
Precision $\pm 0.3^{\circ}\text{C}$
Range - 40 to 85°C
- 40 to 185°F

Humidity Sensor
Precision $\pm 3\% \text{RH}$
Range 0 to 100%

Ambient Light Sensor
Precision $\pm 3\%$
Rang 0.01 to 83K lux

Vibration Index Sensor
Precisio 4mg
Range - 16 to 16g

External Temperature Sensor
Precision $\pm 0.5^{\circ}\text{C}$
Range - 55 to 125°C
- 67 to 257°F

- ? Sensors are at the heart of any IoT application.
- ? As the name suggests, they sense the environment and retrieve data.
- ? Sensors are the starting point of any IoT application.
- ? It fetches data for us to operate on.
- ? Sensors could be analog or digital.
- ? Temperature sensor in a thermometer is an example of it. It is used to build temperature monitoring application.

Enabling Technologies - Sensors

? Some examples of sensors that could be regarded as enabling technologies are as follows.

- Weather tracking system uses temperature/humidity/moisture sensors.
- Vehicle health monitoring sensors keep track of speed, tyre pressure, etc.
- On Board Diagnostics (OBDs) used for collecting all critical information from an automobile to detect error.
- Vibration sensors are used to track the quality of buildings/structures.
- Water quality is monitored through sensors that measure PH, chloride level, etc.
- PIR sensor is used in pedestrian signal operation with human presence detection.

Enabling Technologies - Cloud Computing

P P SAVANI
UNIVERSITY

- ❑ The next technology that is highly significant in IoT is cloud computing.
- ❑ Cloud has grown much more popular because it serves as an affordable, effective and efficient medium for data storage.
- ❑ Data storage plays a major role in IoT.
- ❑ Cloud services are categorized as follows:
 - ➔ IaaS (Infrastructure-as-a-Service):
 - In this cloud service, one can choose virtual machines over physical machines.
 - It is a form of cloud computing that provides virtualized computing resources over the Internet.
 - The users manage the machines, select the OS and underlying applications, and pay per their use.

Enabling Technologies - Cloud Computing

P P SAVANI
UNIVERSITY

→ PaaS (Platform-as-a-Service):

- This is a cloud computing model in which the cloud service provider delivers hardware and software tools needed for application development to users over the Internet.
- A PaaS provider hosts the hardware and software on its own infrastructure. Users have to build, manage and maintain the applications as per their requirement.

→ SaaS (Software-as-a-Service):

- In this model, a complete software application is provided to the user.
- It can also be called application as a service. This service can be availed by paying a monthly, yearly, etc., subscription.
- Some well-known service providers in the market are Amazon web services, Azure and Adafruit.

Enabling Technologies - Big Data Analytics

P P SAVANI
UNIVERSITY

- ? Data is everywhere, and from every function or operation we get more data.
- ? IoT is all about collecting data from various sensory nodes.
- ? Handling the huge data is fundamental to make the application a success.
- ? The biggest challenge with big data is 4Vs. Volume, Variety, Speed (Velocity) at which it comes and its Veracity.

Enabling Technologies - Big Data Analytics

P P SAVANI
UNIVERSITY

? Scale (Volume):

- ➔ Huge volume of data is generated every minute.
- ➔ Storage has become inexpensive and hence, cost-related challenges have reduced.
- ➔ Cloud storage and hardware storage both have become affordable because of the tremendous growth in the semiconductor industry.

? Complexity (Variety):

- ➔ Data no longer comes from one single source.
- ➔ It also comes in different formats (e.g., audio, video, text and image) and has to be interpreted systematically.
- ➔ Varieties of data becomes a huge challenge.

Enabling Technologies - Big Data Analytics

P P SAVANI
UNIVERSITY

? Speed (Velocity):

- ➔ The rate at which data is generated very fast.
- ➔ Also, data dynamics changes very frequently.
- ➔ Nowadays, data comes from anywhere – from fit bit watches to refrigerators.
- ➔ All the data pours in at a very high speed, which makes it very challenging.

? Data in doubt (Veracity):

- ➔ How accurate is all this data anyway?
- ➔ Because we are now rely on it
- ➔ The data's nature alters dynamically and uncertainty is often seen.
- ➔ So, it would be challenging to process this unstable data.

Enabling Technologies - Big Data Analytics

P P SAVANI
UNIVERSITY

? So the question is: “Who is generating all this data?” A partial list to answer this is as follows:

- Sensors from security systems.
- Sensors from weather monitoring systems.
- Sensors from car/navigation systems.
- Sensors from water quality monitoring systems.
- Data from wearables (e.g., bands).
- Data from industrial equipment (e.g., motor health).
- Sensors from bridges/roads about traffic density and other factors.
- Social media (e.g., tweets, photo uploads, etc.).

? In IoT data is everything. so, data analytics is one of the enabling technologies for building a complete and IoT application.

Enabling Technologies - Embedded Computing Boards

P P SAVANI
UNIVERSITY

- ❓ An embedded computing board a very important component to bring IoT design to reality.
- ❓ For making the prototype the computing boards play vital role.
- ❓ The computing boards available in the market are driven by microcontrollers or processors.
 - ➔ Some of the boards are as follows:
 - Raspberry Pi.
 - Arduino (many variants).
 - NodeMCU.
 - Intel Edison.
- ❓ All these boards are small, yet smart.
- ❓ Also, the cost involved is very minimal and one can get these boards at cheap rate.

Enabling Technologies - Communication Protocols

P P SAVANI
UNIVERSITY

? Protocols are the pillars for good IoT infrastructure and hence are very important in communication.

? Data exchange happens through these protocols, which take care of the following:

- Addressing.
- Format of the messages.
- Message security (encryption and decryption).
- Routing.
- Flow control.
- Error monitoring.
- Sequencing.
- Retransmission guidelines.
- Segmentation of the data packets.

Enabling Technologies - User Interfaces

P P SAVANI
UNIVERSITY

- ❓ All devices should have an intuitive user interface.
- ❓ IoT devices/services should be designed in such a way that accessing and handling the services are easier and comfortable for the end user.
- ❓ Generally , the end user shall be provided “mobile application or web application”.
- ❓ The application should be stable and elegant.

IoT Challenges

? The following are some of the challenges - technical and non-technical during building an IoT application .

1. Security/Personnel safety:

- Security is one of the most significant challenges.
- Number of IoT devices are gradually increasing, so user data becomes more vulnerable to theft.
- Poor security features can let attackers damage the whole network and the rest of the devices could also become vulnerable.
- People's personal safety is also a concern and challenge.
- The implants and wearable used by people should be safe even from physical harm.

IoT Challenges

2. Privacy:

- ↪ One could be tracked/monitored by anyone, as we are connected 24×7 to the Internet.
- ↪ So, there is a threat on user data and raises a question on user privacy.
- ↪ “How do we ensure that the data that is sensed and collected from the user is with their permission?”

IoT Challenges

3. Data extraction with consistency from complex environments:

- It is a huge challenge to sense and extract data from complex environments.
- For Example, variation in temperature could also damage the products being transported.
- Maintained the temperature is very critical and should be accurately monitored.
- If the temperature is about to change, then the corrective action has to be taken.
- Data extraction and storage in the cloud could be more challenging if the internet is not available.
- Extracting data inside a room is different from extracting data from an open environment.

IoT Challenges

4. Connectivity:

- This is a serious challenge that the IoT world must acknowledge.
- Since the Internet is itself a giant collection of networks and devices and IoT is a part of it. So requirement of wired and wireless connectivity is a necessity.
- The usage of frequency / spectrum is also to be noted.
- There are spectrum regulations to be followed based on the country for which the application is being developed.
- 2.4 GHz band is the ideal band everywhere.

IoT Challenges

5. Power requirements:

- All the IoT devices require power and most of them are battery operated.
- Even though we now have long-lasting batteries that are economical, demand for power is on the rise.
- Usage of green power sources such as solar and wind should be motivated.
- If the power requirements are met appropriately, IoT can be even more powerful.

6. Complexity involved:

- IoT is not easy. It needs a lot of different domains to integrate into a cohesive system.
- There is very limited expertise available in the market, but the growth is very rapid.
- The toolkits, software and hardware are not abundant and real skill is required to build an application.

IoT Challenges

7. Storage:

- Cloud is becoming mandatory for the data to be stored and analyzed.
- The challenge with respect to this aspect is connected to the following points:
 - Which cloud do we use (private, public, or hybrid)?
 - How do we identify the service provider?
 - How much does it cost?
 - Do we really need cloud?

IoT Trends: Edge Computing

P P SAVANI
UNIVERSITY

Edge computing involves **processing data near its source** instead of sending it long distances to be processed by a remote server.

Key Benefits:

- Faster response time for critical systems
- Reduced bandwidth and cloud dependency
- Localized data privacy and control

Use Cases:

- Smart factories
- Predictive maintenance
- Surveillance cameras with object detection

IoT Trends: AI Integration in IoT

P P SAVANI
UNIVERSITY

- Artificial Intelligence (AI) is combined with IoT devices to **analyze data, learn from it, and make intelligent decisions** automatically.
- For example, a smart security camera can detect unusual movements and alert the owner without human involvement.
- AI makes IoT devices more **autonomous, efficient, and predictive.**

IoT Trends: Digital Twins

- A digital twin is a **virtual copy** of a real-world object (like a machine, building, or even a person).
- It allows engineers or doctors to **monitor, test, and predict issues** using simulations—without touching the actual object.
- Digital twins are widely used in **manufacturing, space missions, and healthcare**.

IoT Trends: Fog Computing

P P SAVANI
UNIVERSITY

- Fog computing acts as a **bridge between edge devices and the cloud.**
- It processes data **in local networks (fog nodes)** rather than sending everything to the cloud, improving **speed, security, and bandwidth usage.**
- It is useful in time-sensitive applications like **smart traffic systems or power grids.**

IoT Trends: 5G for IoT

P P SAVANI
UNIVERSITY

5G is the **fifth generation** of mobile networks.

It provides:

- **Faster speeds** (10x faster than 4G),
- **Lower latency** (millisecond delays),
- Ability to connect **millions of IoT devices** simultaneously.

This is essential for applications like **autonomous vehicles, smart cities, and remote healthcare.**

IoT Trends: IoMT (Internet of Medical Things)

P P SAVANI
UNIVERSITY

IoMT includes **smart healthcare devices** connected to the internet, such as:

- Wearable health monitors (e.g., fitness bands)
- Remote patient monitoring systems
- Smart inhalers or insulin pumps.

These devices help doctors **track patient health in real time**, improving care and saving lives.

IoT Trends: IIoT

(Industrial Internet of Things)

P P SAVANI
UNIVERSITY

Industry 4.0 continues its momentum in 2025 with **massive IoT deployment in manufacturing**, powered by smart sensors, machine vision, and robotic automation.

IIoT applies IoT in **industrial environments**, like:

- Manufacturing,
- Oil and gas,
- Power plants.

Smart machines and sensors collect data to:

- Detect faults early,
- Predict maintenance needs,
- Optimize energy and productivity.

This is the foundation of **smart factories and Industry 4.0.**

IoT Trends: Smart Cities

P P SAVANI
UNIVERSITY

Cities globally are deploying IoT to enhance **sustainability, safety, and citizen engagement.**

Smart cities use IoT technology to improve:

- **Traffic flow** (smart signals),
- **Public safety** (CCTV & emergency systems),
- **Water and waste management** (smart bins),
- **Energy saving** (smart lighting).

This results in **better quality of life**, cleaner environments, and more efficient services.

P P SAVANI
UNIVERSITY

Thank You
